                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                           The present invention describes a human tumour necrosis factor receptor designated Ztnfr12 [1]. [1] has cytostatic, immunosuppressive, dermatological, antiinflammatory, neuroprotective, antidiabetic, antiarthratic, antiarthmatic, nephrotropic and hypotensive activities, and can be used in gene therapy. [1] can be used for inhibiting, in a mammal, the activity of a ligand that binds Ztnfr12 (e.g. ZTNF4), for treating disorders and diseases associated with B (c.g. Tymphocytes, activated B lymphocytes or resting B lymphocytes, and for inhibiting the proliferation of tumour cells. [1] is useful for treating cutoimmune disorders such as systemic lupus expthematosus, mysathenia gravis, multiple sclerosis, insulin dependent diabetes mellitus, asthma, rheumatoid arthritis, bronchitis, emphysema and end stage renal failure or renal disease such as glomerulonephritis, vacultis, chronic lymphoid cleukaemia, nephritis, and pyelonephritis, and for treating renal cleukaemia, multiple myelonas, lymphonas, light chain neuropathy, or amyloidosis, hypertension, large vessel diseases, graft-versus host disease, graft rejection and Crohn's disease. [1] is useful for modulating the immune system, for regulating B cell responses and development, for modulating and cytokine production, and for modulating T and B cell communication. Human Ztnfr12 is located to chromosome 22q13.2. The crommunication. Human Ztnfr12 is located to chromosome 22q13.2. The communication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                     Novel isolated human tumor necrosis factor receptor polypeptide, termed 2tnfr 12, useful for treating autoimmune disorders, emphysema, end stage renal failure or renal disease and lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 APPVAGGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVKFNWYVDGVEVHNAKTK 60

Human modified immunoglobulin moiety #3. AAE35220 standard; protein; 250 AA (first entry) 28-MAY-2003 AAE35220; AAE35220

g ò

Transmembrane activator; calcium modulator; nephrotropic; antibacterial; TYCI; tumour necrosis factor-like protein; ZTNES; ZTNEY; immunoglobulin; anaemia; gene therapy; cytostatic; antiinflammatory; immunosuppressive; glomerulonephritis; asthma; bronchitis; graft rejection; septic shock; glomerulonephritis; neuroprotective; cyclophilin ligand-interactor; human; autoimmune disease; systemic lupus erythematosus; multiple sclerosis; diabetes mellitus; rheumatoid arthritis; renal disease; inflammation. Homo sapiens Synthetic.

WO200294852-A2 28-NOV-2002

```
The invention relates to fusion proteins comprising transmembrane activator and calcium modulator and cyclophilin ligand-interactor (TACI) receptor group that binds tumour necrosis factor-like protein (STNRP) 2 or ZTNP4; and an immunoglobulin group comprising a constant region of an immunoglobulin. The invention is used to manufacture a medicament for inhibiting the proliferation of tumour cells in a mammalian subject. The composition comprising the fusion protein may also be used in treating autoimmune diseases (e.g. systemic lupus erythematosus, multiple sclerosis, diabetes mellitus, rheumatoid arthritis and asthma), renal diseases (e.g. glomerulonephritis), bronchitis, inflammation, graft rejection, anaemia and septic shock. The fusion proteins are also used in molety used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transmembrane activator and calcium modulator and cyclophilin ligand-
interactor (TACI)-immunoglobulin fusion protein, for treating cancer or
diabetes, comprises a TACI receptor group and an immunoglobulin group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; Col 110-111; 71pp; English

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Crystallographic refinement and atomic models of a human Fc fragment and its complex with fragment B of protein A from Staphylococcus and its complex with fragment B of protein A from Staphylococcus aureus at 2.9- and 2.8-A resolution.";

Biochemistry 20:2361-2370(1981).

-! MSCELLANBOUS: Nie has the GIM(17) allotypic marker, 97-K, and the GIM(3) markers, 239-D and 241-L. KOL and EU sequences have the GIM(3) marker and the GIM (non-1) markers.

-! MISCELLANBOUS: Nie also differs in the amidation states of 35, 116, 198, 269 and 272.

-! MISCELLANBOUS: EU also differs in the amidation states of residues 155, 166, 177, 195, 198, 269, and 272 and in the order of residues
                                                                                                           DISULFIDE BONDS.

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Sun, Lee-Hwei K
APPLICANT: Sun, Cecily R
TITLE OF INVENTION: For fusion proteins of human erythropoietin with increased biologi
FILE REFERENCE: 02SUN001
CURRENT APPLICATION NUMBER: US/09/932,812
CURRENT APPLICATION NUMBER: 2011-10-30
NUMBER OF SEQ ID NOS: 22
SOFTWARE: Patentin version 3.1
FURTHER PATENTIAL SUN APPLICATION OF SEQ ID NOS: 22
SEQ ID NOS: 22

Immunoglobulic-derived binding molecules that do not activate complement or trigger cytotoxic activities and maintaining desirable immunoglobulin properties.

Claim 12; Fig 17; 81pp; English.

and This sequence represents the mutated CH2 molecule Gideltaac, and is a binding molecule of the invention. The recombinant binding molecule is capabble of binding a target molecule without triggering complement dependent lysis, or the cell-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; a (b) an effector domain that is homologous to all or part of a constant

```
compain of a human immunoglobulin G (IgG) heavy chain. The binding molecule is used to bind a target molecule (especially FogammaRIID cortains inhibition of B cell activation, mast cell degranulation or phagocytosis). The binding molecule can be used to prevent or inhibit the binding molecule can be used to prevent or inhibit the binding molecule is useful for the treatment of graft-verocetic probability of a second binding molecule e.g. an antibody, to the target condecule. The binding molecule is useful for the treatment of graft-verons transplant rejection, bone-marrow transplant rejection, bone-marrow transplant cortain transplant rejection, autoimmune thrombocytopaenia and arthritis, alloimmunity (e.g. vasculitis, autoimmunity (e.g. catoimmune thrombocytopaenia, asthma and allergy), chronic or acute inflammatory diseases (e.g. Crohn's, HDN chronic or acute inflammatory diseases (e.g. Crohn's, HDN chronic or acute inflammatory diseases (e.g. Crohn's, HDN cortain and cortains). Goodpastures, sickle cell anaemia and cortains the corronary artery occlusion). The binding molecules do not activate complement or trigger cytotoxic activities through FogammaR and desirable corpoperties have been retained. The polypoptides do not contain nonthuman amino acids, and are therefore likely to have reduced immunogenicity. Further, they still bind Protein A, which is consistent changed all per presents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Immunoglobulic-derived binding molecules that do not activate complement or trigger cytotoxic activities and maintaining desirable immunoglobulin

```
This sequence represents the mutated CH2 molecule Gideltaab, and is a binding molecule of the invention. The recombinant binding molecule is capable of binding a target molecule without triggering complement dependent lysis, or the cell-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; and (C) an effector domain that is homologous to all or part of a constant comparing inhibition of B cell activation, mast cell degranulation or the planding molecule (especially FegammaRIID causing inhibition of B cell activation, mast cell degranulation or phagocytosis). The binding molecule can be used to prevent or inhibit the binding molecule can be used to prevent or inhibit the consequence. The binding molecule, e.g. an antibody, to the target consequence or activate in the binding molecule is useful for the treatment of graft-vs. The binding molecule is useful for the treatment of graft-vs. The binding molecule is useful for the treatment of graft-vs. The binding molecule is useful for the treatment of graft-vs. The binding molecule is useful for the treatment of graft-vs. The binding molecule and arthritis), alloimmunity (e.g. concent) autoimmunity (e.g. concent) autoimmunity (e.g. crohn's, HDN chronic or acute inflammatory diseases (e.g. Crohn's, HDN coronary artery occlusion). The binding molecules do not activate complement or trigger cytotoxic activities through FegammaR and desirable thuman amino acids, and are therefore likely to have reduced immunogeniciby. Further, they still bind Protein A, which is consistent contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and contain and

gene. The vector also includes a heavy chain immunoglobulin enhancer and the human gammal constant region (CH). The VH region of 128.1 was 1901ated by polymerase chain reaction and cloned into plasmid pAH4274. This was achieved by digesting the plasmid and the product with Ecogy and NheI. The VH gene was inserted in-frame with the human gammal CH region CH at the 3' end of the VH-J region by means of a NheI site. 128.1 is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuro- pharmaceutical or diagnostic agencia disorders eg. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzheimers disease. It may also be used for diagnostic methods. (Updated on 25-WAR-2003 to correct PN field.)

The variant mediates antibody-dependent cell-mediated cytotoxicity (ADCC) in the presence of effector cells more effectively than the parent polypeptide and comprises at least one amino acid modification at position 280 in the autoimmune diseases. The present sequence represents the amino acid sequence of a human immunoglobulin G, IGG, CH region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 APPVAGGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVKFNWYVDGVEVHNAKTK 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                            In humans, IgG1 may exist as either of two allotypes at site 1, 2 or 17. The inventor's propose eliminating these allotypes by amino acid changes to agree with the sequences of IgG2, IgG3 and IgG4. None of the allotype sites (1, 2 and 17) are located within the CH2 domain. New "isoallotypes" should be suitable for therapeutic use in all patients. See AAR27678-R27681. (Updated on 25-MAR-2003 to correct PN field.)

This vector contains open reading frames encoding the heavy chain variable region (VH) of the antibody 128.1, an amplicillin resistance gene and a histidine (histidinol) selection marker. Transcription of the VH gene is from the VH promoter of the murine 27.44

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a binding domain-immunoglobulin fusion protein comprising a binding domain polypeptide that is fused to an immunoglobulin hinge region polypeptide, an immunoglobulin heavy chain CH2 constant region polypeptide that is fused to the hinge region polypeptide that is fused to the CH3 constant region polypeptide that is fused to the CH2 constant region polypeptide or the CH2 constant region polypeptide. The hinge region polypeptide comprises: a wild-type human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues; where the mutated human IgG1 immunoglobulin hinge contains 2 cysteine residues, where the first cysteine is not mutated; a mutated human IgG1 immunoglobulin hinge region polypeptide contains 2 cysteine residues, where the first cysteine is not mutated; a mutated human IgG1 immunoglobulin hinge region polypeptide derived from (a) having 3 or more cysteine residues, where the mutated human IgG1 immunoglobulin hinge region polypeptide contains no more than one
                                                                                                                                                                                                                                                                                                                                                                                         Binding domain, immunoglobulin, fusion protein, cytostatic; antiarthritic; immunosuppressive; antidiabetic; antithyroid; neuroprotective; hinge region; immunoglobulin heavy chain; CH2 constant region; CH3 constant region, 1gG1, antibody dependent cell-mediated cytotoxicity; ADCC; complement fixation; antibody dependent cell-fiscorial cytotoxicity; ADCC; complement fixation; antignate condition; B-cell disorder; melanoma; carcinoma; sarcoma; rheumatoid arthritis; myaethenia gravis; Grave's disease; type I diabetes mellitus; multiple sclerosis; autoimmune disease.

cysteine residue; and a mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues; where the mutated human IgG1 immunoglobulin hinge region polypeptide contains no cysteine residues. The binding domain-immunoglobulin fusion protein is capable of at least one immunological activity comprising antibody capendent cell-mediated cytocoxicity (ADCC) and complement fixation. The binding domain polypeptide is capable of specifically binding to an antigen. Also included are an isolated polymucleotide encoding the binding domain-immunoglobulin fusion protein, a recombinant expression construct, producing the polymucleotide (operably linked to a promoter), a host cell transformed or transfected with a recombinant expression construct, producing the binding domain-immunoglobulin fusion protein, a construct, producing the binding domain-immunoglobulin clusion protein or a broad construct, producing the binding domain-immunoglobulin fusion protein suspected of having a malignant condition or a B-cell disorder. The binding domain-immunoglobulin fusion protein is useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, carcinoma or sarcoma, rheumatoid arthritis, subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, carcinoma or sarcoma, rheumatoid arthritis, cultimunoglobulin fusion protein-associated protein sequence is a binding domain-immunoglobulin fusion protein-associated protein sequence is a binding domain companding protein-associated protein sequence. The sequence data for this patent formed part of the printed specification can disting a subject the sequence. The present sequence in the printed specification by their SEQ ID cumber therefore none of the sequences can be explicitly identified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polymerase chain reaction; primer; PCR; amplify; murine; pAH4625; heavy; light; chain; variable; constant; region; anti-human; pAH4807; transferrin; receptor; antibody; brain; capillary; pAH4808; gamma-2; endothelial cell; conjugate; neuropharmaceutical; gamma-3; gamma-4; diagnostic; agent; tumour; AlDS; stroke; epilepsy; monoclonal; parkinsons disease; Alzheimers disease; SP2/0 cell.

The sequences given in AAR41715-18 are encoded by the expression vector pAH4808. This vector represents the cloning of the human gamma isotype, gamma-4, with the variable region of the murine monoclonal antibody (18.1. This plasmid encodes a chimeric monoclonal antibody in which the heavy chain (VH) is derived from a murine source and the sequences encoding CHI, CH2 and CH3 are derived from a human source. This vector, in combination with the chimeric light chain vector, pAG4611 (see also AAQ43845), was transfected into SP2/0 cells and clones were isolated. Is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent or diagnostic agent. The conjugate may also be used for diagnostic gentuclogical disorders eg. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzhaimers disease. It may also be used for diagnostic methods. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                    an IgG constant domain having at least one amino acid modification. The immunoglobulins are used in the treatment or prevention of a disease or disorder by passive immunotherapy for vaccinating a subject and for in vivo diagnosis of a subject. The disease and disorders include a gamma globulinaemia, hypogammaglobulinaemia, autoimmune diseases, graft-versusthest, lymphoid malignancies and passive immunotherapies and also for the treatment of various systemic infections. The present sequence is human immunoglobuling (IgG1) Fc region second constant (FR2) domain
                                                                                                           The invention relates to a modified immunoglobulin (IgG1) which comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a new composition comprises a variant of a parent polypeptide having at least a portion of a Fc region. The variant mediates antibody-dependent cell-mediated cytotoxicity (ADCC) in the presence of effector cells more effectively than the parent polypeptide and comprises at least one amino acid modification at position 280 in the Fc region. The composition is useful in treating diseases e.g.,
Modified immunoglobulins useful in the treatment of autoimmune diseases, comprises at least one amino acid modification relative to a wild-type immunoglobulin constant domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for generating an immune response to an antigen in a patient. The method comprises administering to the patient an immunoglobulin (Ig) or its portion where the Ig has at least one peptide epitope of the antigen attached to the Ig or its portion and administering the immunoglobulin or its portion in conjunction with a RNA segment. A recombinant human Ig molecule capable of binding to an FC gamma receptor (FcgammaR) of an antigen presenting cell (APC) was used to illustrate the invention. The recombinant human Ig molecule comprises a CH3 region (ADL90102), a CH2 region (ADL90103), a hinge region (ADL90104) and a flanking peptide (ADL90105).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Generating an immune response to an antigen, useful for generating desired T cell responses comprises administering an immunoglobulin having one peptide epitope of the antigen attached to the immunoglobulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

The invention relates to a new composition comprises a variant of a parent polypeptide having at least a portion of a FC region. The variant mediates antibody-dependent cell-mediated cytotoxicity (ADCC) in the presence of effector cells more effectively than the parent polypeptide and comprises at least one amino acid medification at position 280 in the FC region. The composition is useful in treating diseases e.g., autoimmune diseases. The present sequence represents a CH2 region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 APELLGGPSVFLFPPKDTLMISRTPEVTCVVVDVSHEDPEVKFNWYVHGVEVHNAKTK 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antibody dependent cell-mediated cytotoxicity; ADCC; complement fixation; andignant condition; Becal disorder; melanoma; cardinoma; sarcoma; rheumatoid arthritis; myasthenia gravis; Grave's disease; type I diabetes mellitus; multiple sclerosis; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                               cell activating and immunosuppressive activity, and is used to treat transplant patients to prevent rejection. The antibody can be engineered to contain a human Fc region. By transferring the binding specificity into a human framework, the immunoganicity is reduced without affecting the immunosuppressive activity. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61
                                                                                                                                                                                                                                                                                           New humanised OKT3 antibody with mutated Fc receptor binding region - useful as immunosuppressant to reduce transplant rejection, lacks the T-cell activating side effects of wild type antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9

The inventorial relaters to a binding domain polypeptide that is fused to an immunoglobulin hinge region polypeptide that is fused to the hinge region polypeptide that is fused to the hinge region polypeptide that is fused to the hinge region polypeptide. The constant region polypeptide comprises: a wild-type human igdi immunoglobulin hinge region polypeptide comprises: a wild-type human igdi immunoglobulin hinge region polypeptide; derived from (a) having 3 or more cysteine residues; where the first cysteine is not mutated; a mutated human igdi immunoglobulin hinge region polypeptide contains 2 cysteine residues; where the first cysteine is not mutated; a mutated human igdi immunoglobulin hinge region polypeptide contains or more cysteine residues; where the mutated human igdi immunoglobulin hinge region polypeptide contains no more than one cysteine residue; mutated human igdi immunoglobulin hinge region polypeptide contains no cysteine residues; may having 3 or more cysteine residues; where the mutated human igdi immunoglobulin hinge region polypeptide contains no cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains on cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains construct construct least one immunological activity comprising the binding domain-immunoglobulin fusion protein, a recombinant expression construct comprising the polymuclectide (operably linked to a promoter) construct comprising the polymuclectide (operably linked to a promoter) and a host for a most construct comprising the polymuclectide (operably linked to a promoter).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               construct, producing the binding domain-immunoglobulin fusion protein, a pharmaceutical composition comprising the binding domain-immunoglobulin fusion protein, a pharmaceutical composition comprising the binding domain-immunoglobulin fusion protein a subject thaving a mailgnant condition or a B-cell disorder. The binding domain-immunoglobulin fusion protein is useful for treating a subject baving or suspected of having a mailgnant condition or a B-cell disorder. The binding domain-immunoglobulin fusion protein-sar comman, rheumatoid arthritis, mysthenia gravis, Grave's disease, type I diabetes mellitus, multiple calerosis or autoimmune disease. The present sequence is a binding domain immunoglobulin fusion protein-associated protein sequence. Note: The sequence data for this patent formed part of the printed specification and is also available in electronic format directly from USPTO at sequence data for this patent formed part of the printed specification is also available in electronic format directly from USPTO at sequence the sequence in the printed specification by their SBO ID common therefore none of the sequences can be explicitly identified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61

The sequences given in AAR41707-09 are encoded by the expression vector pAH4625. This vector represents the cloning of the human gamma isotype, gamma-2, with the variable region of the murine monoclonal antibody is gamma-2, with the variable region of the murine monoclonal antibody in which heavy chain (VH) is derived from a murine source and the sequences encoding CHI, CH2 and CH3 are derived from a human source. This vector, in combination with the chimeric light chain vector page 180 AAQ43845), was transfected into SP2/0 cells and clones were isolated. Is an anti-human transferrin receptor antibody which binds to the transferrin receptor antibody which binds to the transferrin receptor antibody which binds to the transferrin receptor antibody which binds to the cransferrin receptor antibody which binds to the transferrin disorders in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent neurological disorders eq. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzhaimers disease. It may also be used for diagnostic methods. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                     Polymerase chain reaction; primer; PCR; amplify; murine; pAH4625; heavy; light; chain; variable; constant; region; anti-human; pAH4807; transferrin; receptor; antibody; brain; capillary; pAH4808; gamma-2; endothelial cell; conjugate; neuropharmaceutical; gamma-3; diagnostic; agent; tumour; AlDS; stroke; epilepsy; monoclonal; Parkinsons disease; Alzheimers disease; SP2/0 cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibody conjugates specific for transferrin receptor - used for diagnosis and treatment of cancer, AIDS and neurological disorders.

```
This sequence represents the mutated CH2 molecule G2deltaa, and is a binding molecule of the invention. The recombinant binding molecule is capable of binding a target molecule without triggering complement dependent lysis, or the cell-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; and comprises: (a) a binding domain capable of binding a target molecule; and compain of a human immunoglobulin G (IgG) heavy chain. The binding constant domain of a human immunoglobulin G (IgG) heavy chain. The binding constant consists in the binding molecule can be used to prevent or inhibit the consists in the binding molecule can be used to prevent or inhibit the consists in the binding molecule can be used to prevent or inhibit the consists in the binding molecule is useful for the treatment of graft-vs-consists or actorimmunity (e.g. vascultis), autoimmune haramplant rejection, bone-marrow transplant correction, bone-marrow transplant correction autoimmune haramplants (e.g. crohn's, HDN chroblastosis foetalis), Goodpastures, sickle cell anaemia and correctivate inflammatory diseases (e.g. Crohn's, HDN corromary artery occlusion). The binding molecules do not activate complement or trigger cytotoxic activities through Fegammas and desirable complement or trigger cytotoxic activities through Fegammas and desirable human amino acids, and are therefore likely to have reduced human amino acids, and are therefore likely how are decembled.
                                                                                                                                                                                                                                                                                                  Binding molecule; CH2 sequence; complement dependent lysis; FcgammaRIID; cell-mediated destruction; human; immunoglobulin G; IgG heavy chain; B cell activation; mast cell degranulation; phagocytosis; vasculitis; Crohn's disease; graft-vs-host disease; organ transplant rejection; bone-marrow transplant rejection; autoimmune disease; asthma; allergy; alloimmune disorder; autoimmune haemolytic anaemia; inflammatory disease; autoimmune thrombocytopaenia; arthritis; erythroblastosis foetalis; encenatal alloimmune thrombocytopaenia; Goodpastures disease; therapy; sickle cell anaemia; coronary artery occlusion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           immunogenicity. Further, they still bind Protein A, which is consistent with being able to cross the human placenta through interaction with FCRn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunoglobulic-derived binding molecules that do not activate complement
or trigger cytotoxic activities and maintaining desirable immunoglobulin
